

DomeWizard™ DW-CLNR Instruction Quick Sheet

By Dotworkz, Inc.

The Dome Wizard allows you to safely clean mounted pan tilt zoom (PTZ) enclosures, static enclosures and mini domes without the use of expensive booms, lift trucks or ladders, all done safely from the ground level. Dome Wizard installs on common acme thread found on some of the most common threaded extension poles. Mitts are removable and replaceable, as well as machine washable.

1. Apply dome cleaning solution to moisten your mitt, making sure it's not too moist but moist enough to clean the surface. Spraying fine mist on Mitt surfaces that will come in contact with lens is the best way to apply to micro-fiber mitt material. Only use Acrylic safe Window or Monitor cleaners, especially those with anti-static agents work best.
2. Make sure the Dome Wizard is firmly affixed to the extension pole using clockwise threading onto extension pole, and adjusted to proper height to reach enclosure lens.
3. For static enclosures (fixed tubular style enclosures with flat lens window), use the outside portion of the microfiber cleaning mitt to clean the flat lens surface.
4. For Minidomes and PTZ enclosures with bubble style lens covers, spread the Wizards fingers around the dome lens and lightly pulse the Dome Wizard up and down applying light pressure, on the down stroke give it a slight Clockwise twist. Light pressure is all that is needed for crystal clear results. Depending on lens dirt condition, a few turns around the lens should complete process.

Dome Wizard Tips

On heavier soiled lens bubbles, Dotworkz suggests that you use two separate mitts with a two-step process:

- First do a pre-clean with the solution applied on first mitt for cleaning the lens
- Then follow up with a fresh clean & dry mitt for a finishing polish to the lens.
